](----- ColinWright Clickable: [ jkldotio Previous discussion: Insulin-like growth factor (IGF) I and II and IGF binding protein-1, -2 and -3 in the midgestational placenta of patients with fetal growth restriction. To investigate the placental insulin-like growth factor (IGF) system, the synthesis and clearance of IGF I and II, the maternofetal transport of IGF I and II, and the binding of IGF I and II to IGF binding proteins (IGFBPs) in pregnancies complicated by fetal growth restriction (FGR). A case-control study. Blood was obtained from all participants after informed consent. Gestational age was estimated by ultrasonography. The study was performed at the Department of Obstetrics and Gynaecology, Karolinska Hospital, Stockholm. Women were examined at the Stockholm FGR cohort. Matched controls from the Stockholm-Uppsala FGR cohort and Stockholm Birth Registry were used. Cases (n = 21) and controls (n = 21) matched for gestational age and pre-existing morbidity. Maternal and cord blood concentrations of IGF I and II, IGFBP-1, -2 and -3 and maternofetal transport of IGF I and II. Maternal IGF I, IGFBP-1 and IGFBP-2 concentrations were significantly reduced in patients with FGR compared with controls (P
